Summary

For this Lab, I have successfully created my first EC2 Instances and created a security group to restrict only my host public IP address to SSH into my EC2 Instance via public key authentication.

One challenge I encountered was that I could not SSH with the private key(.prem) to SSH into the EC2 Instance via WSL. I managed to use a different authentication method that was not taught in the lab and uses PuTTY private key file with PuTTY to authentication to the server via my windows 10 machine instead.

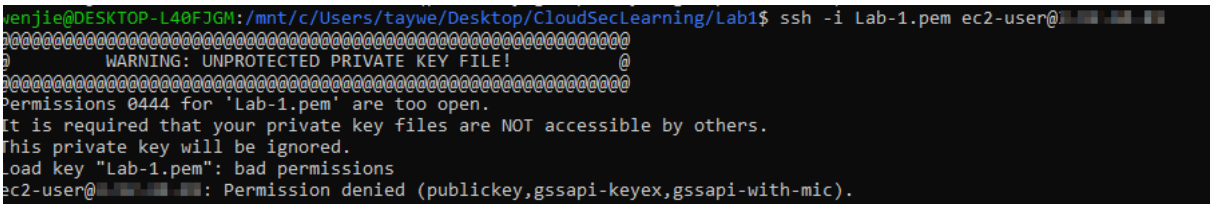

Figure 1. Failed to authenticate via SSH on WSL (.prem private key)

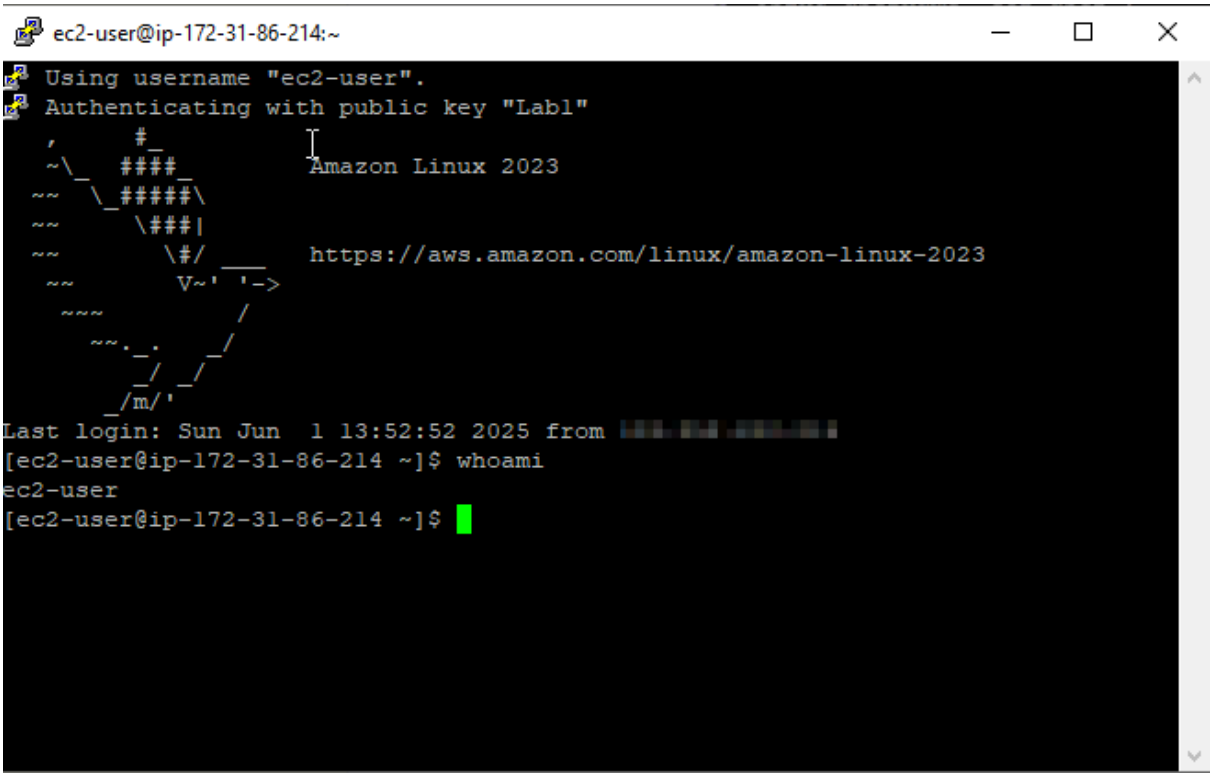

Figure 2. Successfully authenticated to EC2 VM via PuTTY (PuTTY private key file)
